1. INTRODUCTION

1.1 Project Overview

Agriculture is the main aspect of country development. Many people lead their life from agriculture field, which gives fully related to agricultural products. Plant disease, especially on leaves, is one of the major factors of reductions in both quality and quantity of the food crops. In agricultural aspects, if the plant is affected by leaf disease then it reduces the growth of the agricultural level. Finding the leaf disease is an important role of agriculture preservation. After pre-processing using a median filter, segmentation is done by Guided Active Contour method and finally, the leaf disease is identified by using Support Vector Machine. The disease-based similarity measure is used for fertilizer recommendation.

Agriculture Sector remained resilient even after the pandemic in India. It effectively met rising global food demands while maintaining a continuous supply chain of vital food goods across the country. India's agriculture sector employs a large number of people and is second after China in terms of producing fruits and vegetables. Traditional farming methods, on the other hand, are ineffective. It fails to make proper use of all available resources. Because the primary focus is on production, traditional methods frequently result in soil nutrient depletion and weariness. By producing only certain crops, the earth is depleted.

The proposed concept also allows people to detect ailments by simply taking a picture with their smartphones and uploading it to the website. They will be better equipped to recover their crops if they have a better understanding of the sickness that has affected their crop.

1.2 Purpose

Agriculture is the most important sector in today's life. Most plants are affected by a wide variety of bacterial and fungal diseases. Diseases on plants placed a major constraint on the production and a major threat to food security. Hence, early and accurate identification of plant diseases is essential to ensure high quantity and best quality. In recent years, the number of diseases on plants and the degree of harm caused has increased due to the variation in pathogen varieties, changes in cultivation methods, and inadequate plant protection techniques.

An automated system is introduced to identify different diseases on plants by checking the symptoms shown on the leaves of the plant. Deep learning techniques are used to identify the diseases and suggest the precautions that can be taken for those diseases.

2.LITERATUTE SURVEY

[1] Shows a case study related to wireless sensor networks for crop monitoring, growth and measurement of meteorological factors. The paper suggests farmers for application of specific pesticides and insecticides in stressful conditions. There was no focus on soil nutrients, the level of soil fertility and monitoring the crop growth or suggest the crop for the next season in the above proposed paper. The solution to the issues in agriculture trends is proposed in this paper. The study suggests that farmers need to increase the fertility of soil and measure all parameters which are required to grow a crop in healthy condition.

[2] Data mining algorithms are used on agriculture data. The main criterion for this categorization is that if the pH value is greater than 8.5, the soil is unsuitable for crop cultivation; otherwise, it is. To overcome this problem

the proposed system will give necessary suggestion to increase or decrease the pH value of soil.

[3] The proposed system is related to increase net yield rate of the crop, based on the parameter related to the soil and atmosphere. The model gives the Crop prediction which can be carried out by using the "Bayesian algorithm". Data mining is used to extract the large amount of data from the data set and analyses those data to predict the crop yield and suggest the crop. The limitation of this includes atmospheric prediction is not accurate.

[4] In his article, the author proposes a method which helps us predict crop yield by suggesting the best crops. It also focuses on soil types in order to identify which crop should be planted in the field to increase productivity. In terms of crop yield, soil types are vital. By incorporating the weather details of the previous year into the equation, soil information can be obtained. It allows us to predict which crops would be appropriate for a given climate. Using the weather and disease related data sets, the crop quality can also be improved. Prediction algorithms help us to classify the data based on the disease, and data extracted from the classifier is used to predict soil and crop. Due to the changing climatic conditions, accurate results cannot be predicted by this system.

[5] Based on fuzzy logic and neural networks & interval-based partition, the author proposed a model which is used currently in rice to predict crop production using a fuzzy time series model. Using this model and comparing it to an existing algorithm, the result was compared to the reduction in AFER and MSE in the prediction.

2.1 Existing Problem

In most of the existing methods, the process of finding the soil type, identifying the leaf disease and preferring the fertilizer were all carried out manually. The method was prone to various disadvantages. Even when the framework was digitalized, it has certain problems as, predicting a diverse fertilizer for a soil type, certain files regarding the leaf disease or soil type or fertilizer may not be updated. In other situation the system may not provide the needed support. Hence in order to overcome some of these issues, the authors proposed a new approach.

2.2 Reference

1) Shashank Chaudhary, Upendra Kumar, Abhishek Pandey, “Crop Plant Disease Detection Using Image Processing”. International Journal of Innovative Technology and Exploring Engineering (IJITEE), ISSN NO: 2278-3075, 7 May 2019.

This paper discusses various plant diseases and how to improve precision agriculture (PA) using Image processing. The aspects considered are the higher yielding and result in good quality of crop production. Precision agriculture (PA) is necessary to improve agricultural productivity of specific crop. Image processing is an important tool for identification of plant diseases, whereas manual detection of crop plant disease is a difficult task as it takes serious observation (need implementation expert of automated system) and consumes much time. Another outcome from the study is that automatic detection can be very good aspect for identification of crop disease.

2) Shravani V, Uday Kiran S, Yashaswini J S, Priyanka D, “Soil Classification And Crop Suggestion Using Machine Learning”. International Research Journal of Engineering and Technology (IRJET), ISSN: e-ISSN: 2395-0056, p-ISSN: 2395, 6 June 2020.

Agriculture is one of the most important components of our society. Soil is a critical factor for a successful agriculture. The composition of soil differs from soil to soil. The Growth of Crops is affected by these chemical features of soil. Choosing the right type of crops for that particular type of soil is also important. Machine Learning techniques can be used to classify the soil series data. The results of such classification can further be combined with crop dataset to predict the crops that are suitable for the soil series of a particular region and its climatic conditions. Soil dataset and crop dataset are used. The datasets comprise of chemical attributes and geographical attributes of soil and crops. Algorithms like SVM and Ensembling technique can be used to classify the soil series data and predict the suitable crops.

3) Lee, Sue Han, CheeSeng Chan, Paul Wilkin, and Paolo Remagnino. "Deep-plant: Plant identification with convolutional neural networks." In 2015 IEEE International Conference on Image Processing (ICIP), pp. 452-456. IEEE, 2015.

This paper studies convolutional neural networks (CNN) to learn unsupervised feature representations for 44 different plant species, collected at the Royal Botanic Gardens, Kew, England. To gain intuition on the chosen features from the CNN model (opposed to a 'black box' solution), a visualisation technique based on the deconvolutional networks (DN) is utilized. It is found that venations of different order have been chosen to uniquely represent each of the plant species. Experimental results using these CNN features with different classifiers show consistency and superiority compared to the state-of-the art solutions which rely on hand-crafted features.

2.3 Problem Statement Definition

Mr.Narasimma Rao is a 65 years old man. He had a own farming land and do Agriculture for past 30 Years , In this 30 Years he Faced a problem in Choosing Fertilizers and Controlling of Plant Disease.

- Narasimma Rao wants to know the better recommendation for fertilizers for plants with the disease.
- He has faced huge losses for a long time.
- This problem is usually faced by most farmers.
- Mr. Narasimma Rao needs to know the result immediately.

Who does the problem affect?	Persons who do Agriculture
What are the boundaries of the problem?	People who Grow Crops and facing Issues of Plant Disease
What is the issue?	In agricultural aspects, if the plant is affected by leaf disease, then it reduces the growth and productiveness. Generally, the plant diseases are caused by the abnormal physiological functionalities of plants.
When does the issue occur?	During the development of the crops as they will be affected by various diseases.

Where does the issue occur?	The issue occurs in agriculture practicing areas, particularly in rural regions.
Why is it important that we fix the problem?	It is required for the growth of better quality food products. It is important to maximise the crop yield.
What solution to solve this issue?	An automated system is introduced to identify different diseases on plants by checking the symptoms shown on the leaves of the plant.
What methodology used to solve the issue?	Deep learning techniques are used to identify the diseases and suggest the precautions that can be taken for those diseases.

3. IDEATION AND PROPOSED SOLUTION

3.1 Empathy Map Canvas

Agriculture is the main aspect of the economic development of a country. Agriculture is the heart and life of most Indians. By understanding their feelings and problems, we can create a better product and contribute to their lives. For our project, we are getting surveys from farmers to understand what they truly require and desire.

3.2 Ideation and Brainstorming

Agriculture is the most important sector in today's life. Most plants are affected by a wide variety of bacterial and fungal diseases. Diseases on plants placed a major constraint on the production and a major threat to food security. Hence early and accurate identification of plant diseases is essential to ensure high quantity and best quality. In recent years, the number of diseases on plants and the degree of harm caused has increased due to the variation in pathogen varieties, changes in cultivation methods, and inadequate plant protection techniques.

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Tip

You can undo a photo that you've taken to avoid unnecessary clutter.

ILANGYA V

SHALENE V

MONIKASRI

NANDHIE R

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. In the last 10 minutes, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

30 minutes

Category 1

Website for fertilizer recommendation

Interactive user interface to upload images

Identify the disease

Useful to people with no prior knowledge

Cost of using this application is less

Portal for farmers

Pre-trained model for image classification

Interactive user interface to upload images

Deep learning based mathematical model for detecting diseases

Making revolutionary changes in agriculture field

Build keras image classification model

Early detection and management of problems

Category 3

Instant solution

They can find the diseases at early stages

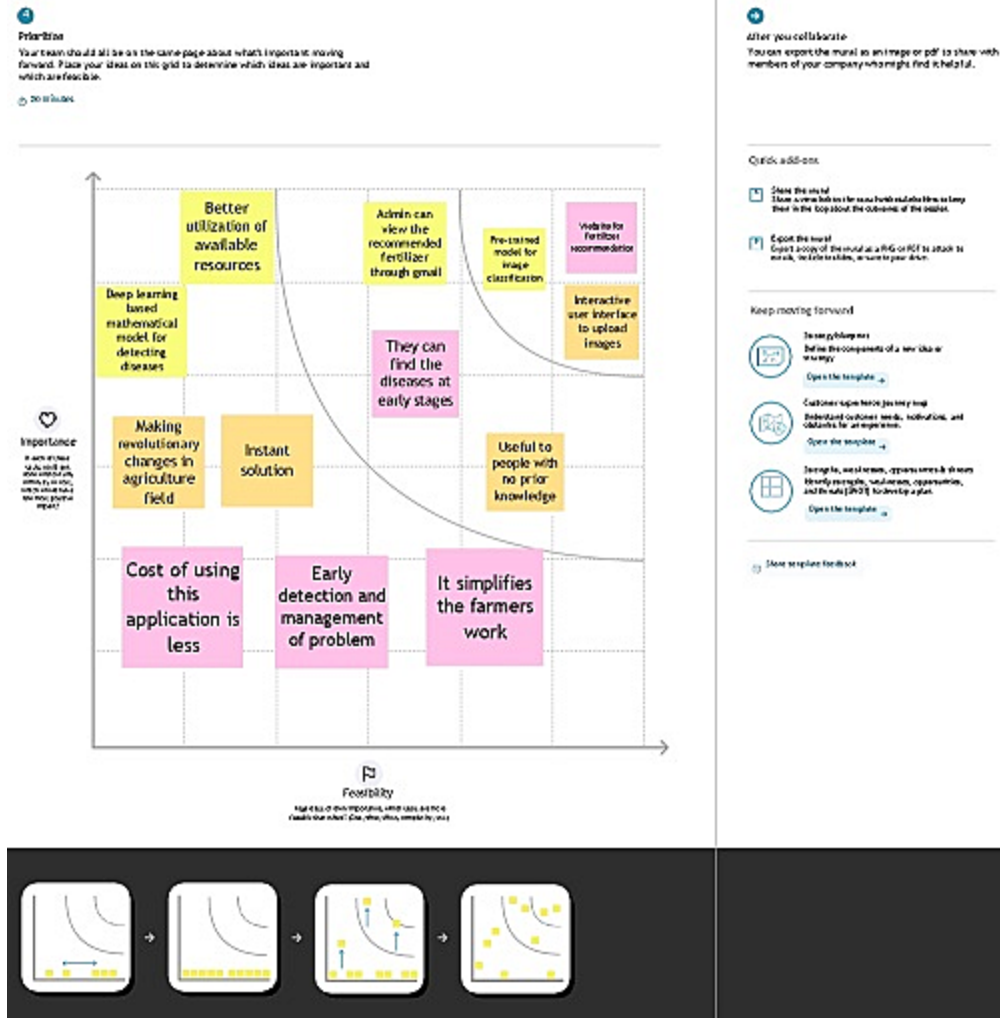

Admin can view the recommended fertilizer through gmail

Smart solution to solve the problem

Better utilization of available resources

Cost of using this application is less

3.3 Proposed Solution

The solution to the problem is Machine learning, which is one of the applications of Artificial Intelligence, is being used to implement the proposed system. Crop recommendation is going to recommend you the best crop you can grow in your land as per the soil nutrition value and along with as per the climate in that region. And recommending the best fertilizer for every particular crop is also a challenging task. And the other and most important issue is when a plant gets caught by heterogeneous diseases that effect on less amount of agriculture production and compromises with

quality as well. To overcome all these issues this recommendation has been proposed . Nowadays a lot of research and work is being implemented in the smart and modern agriculture domain. Crop recommendation is characterized by a soil database comprised of Nitrogen, Phosphorus, potassium. The ensembles technique is used to build a recommendation model that combines the prediction of multiple machine learning. Models to recommend the right crop based on soil value and the best fertilizer to use.

VALUE FOR SOCIETY

Consumers Farming is one of the major sectors that influences a country's economic growth. In country like India, majority of the population is dependent on agriculture for their livelihood. Many new technologies, such as Machine Learning and Deep Learning, are being implemented into agriculture so that it is easier for farmers to grow and maximize their yield.

VALUE FOR ENVIRONMENT

In the crop recommendation application, the user can provide the soil data from their side and the application will predict which crop should the user grow.

For the fertilizer recommendation application, the user can input the soil data and the type of crop they are growing, and the application will predict what the soil lacks or has excess of and will recommend improvements.

For the last application, that is the plant disease prediction application, the user can input an image of a diseased plant leaf, and the application will predict what disease it is and will also give a little background about the disease and suggestions to cure it. These all are to improve the Agriculture, that's slightly reduces the poverty, climatic condition, soil erosion etc ...

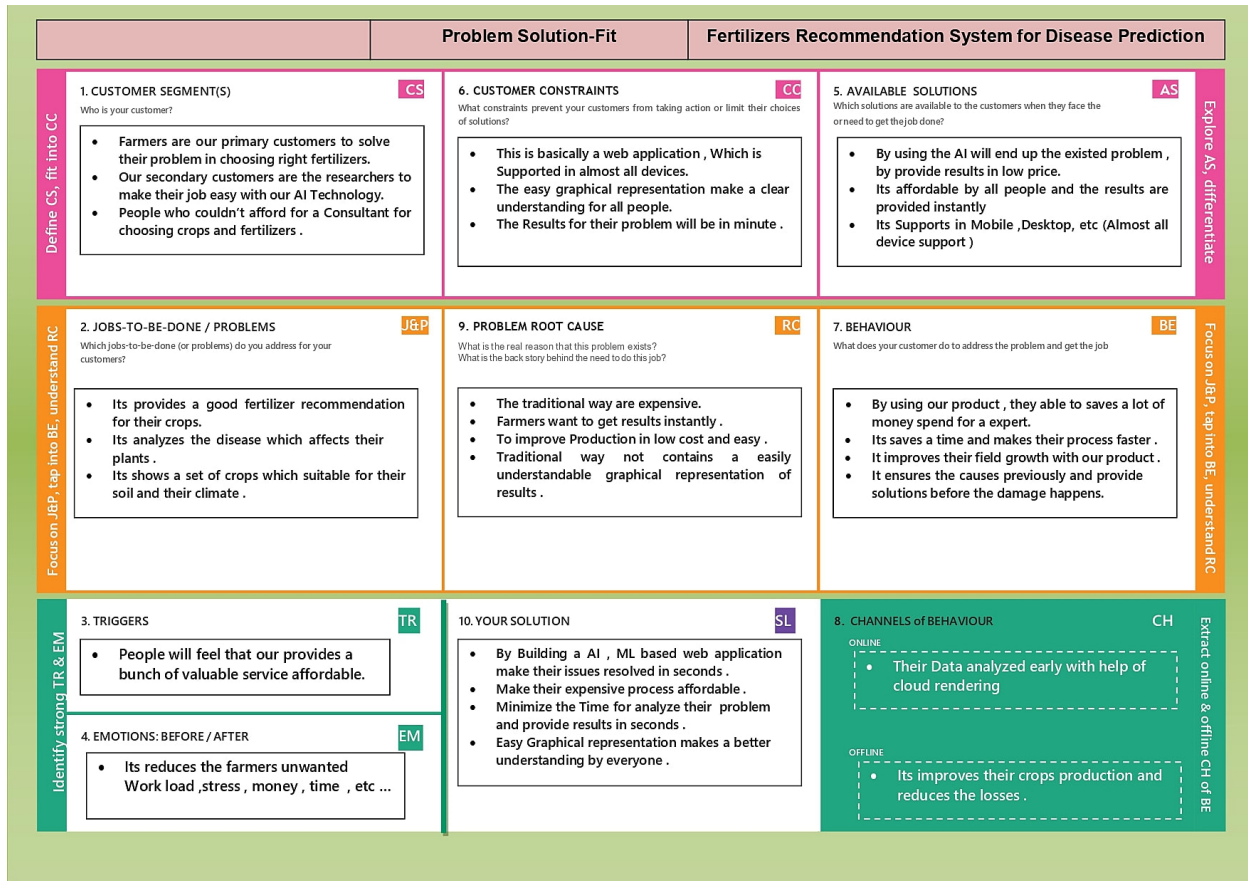

VALUE FOR BUSINESS

Predicting the fertilizers, Analyzing the disease in a tap makes the life of farmers easy with minimal subscriptions would provide an acceptable return for the organization. This action adds a lot of value to the company and the business in society.

FORM FACTORS

Our Fertilizer Recommendation system for disease Prediction is in the form of web application to provide this valuable service to the environment and society.

3.4 Problem Solution Fit

4.REQUIREMENT ANALYSIS

4.1 Functional Requirements

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form
FR-2	User Confirmation	Confirmation via Email
FR-3	User Profile	Filling the profilepage after logging in
FR-4	Uploading Dataset(Leaf)	Images of the leaves are to beuploaded

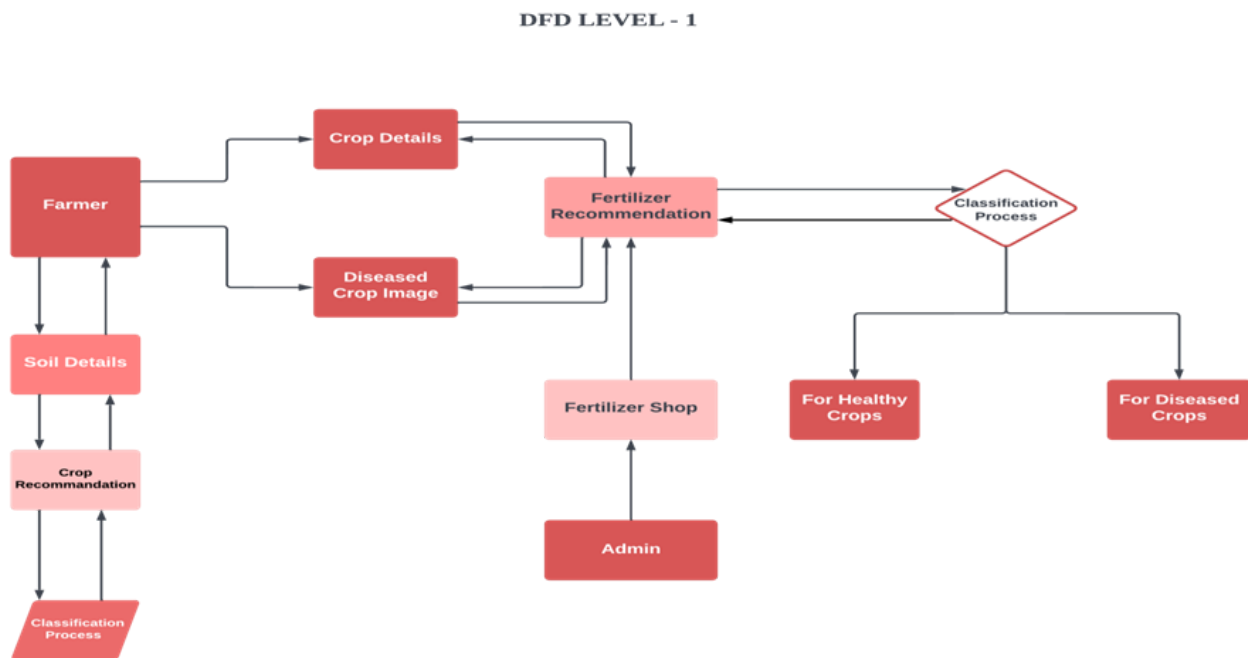

FR-5	Requesting solution	Uploaded images is compared with the pre-defined Model and solution is generated
FR-6	Downloading Solution	The Solution in pdf format which contains the recommendations of fertilizers and the possible diseases.

4.2 Non-Functional Requirements

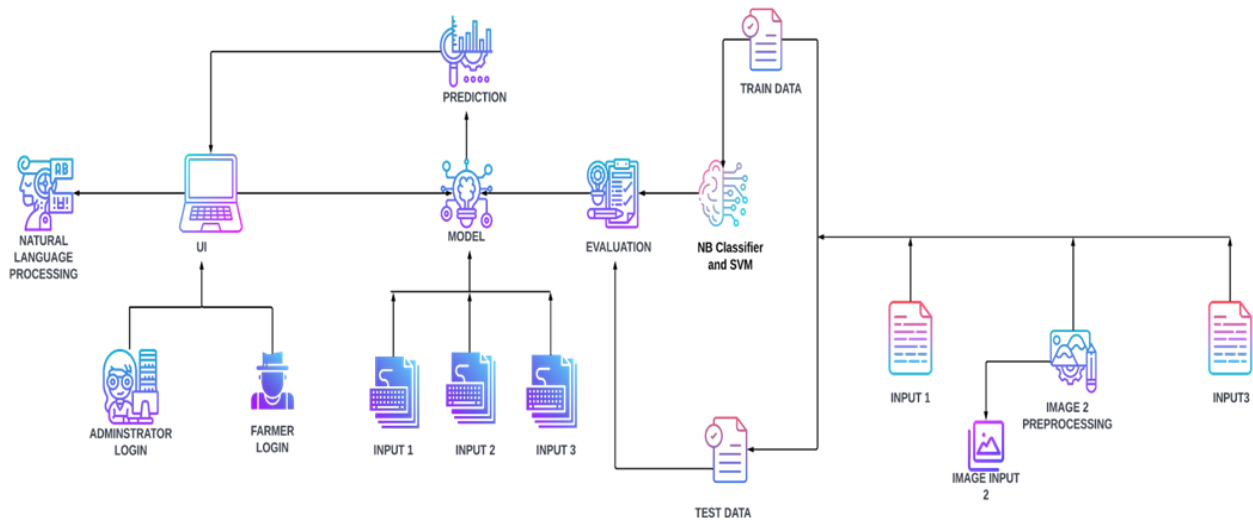

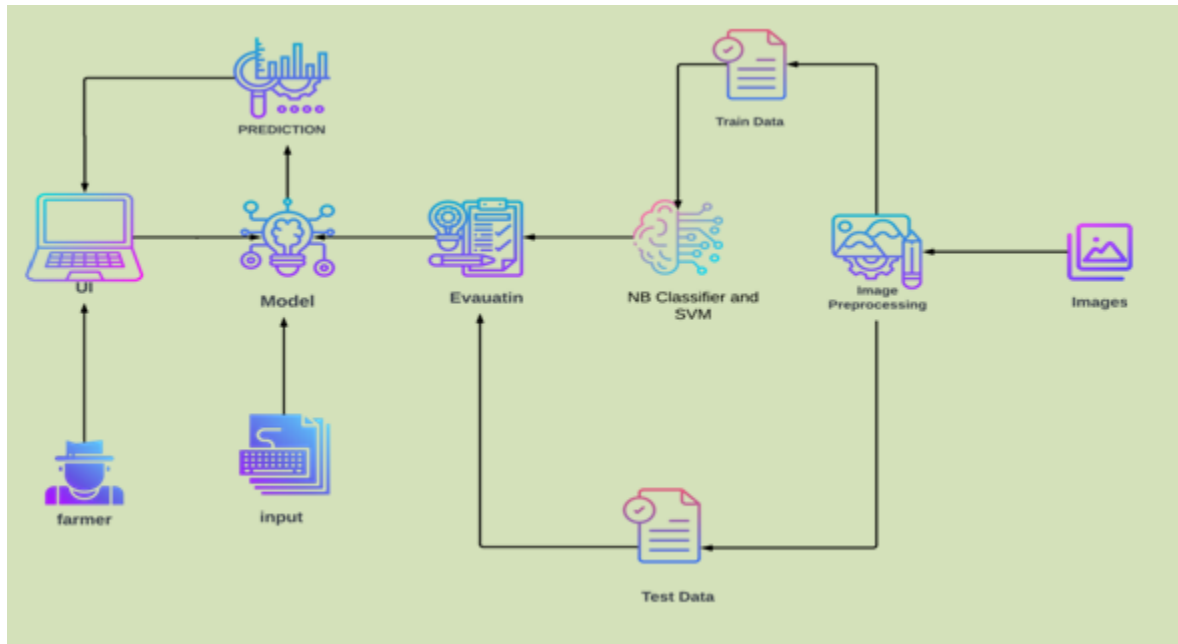

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The system allows the user to perform the tasks easily and efficiently and effectively.
NFR-2	Security	Assuring all data inside the system or its part will be protected against malware attacks or unauthorized access.
NFR-3	Reliability	The website does not recover from failure quickly, it takes time as the application is running in single server
NFR-4	Performance	Response Time and Net Processing Time is Fast
NFR-5	Availability	The system will be available up to 95% of the time
NFR-6	Scalability	The website is scalable

5.PROJECT DESIGN

5.1 Data Flow Diagram

5.2 Solution and Technical Architecture

S.No	Component	Description	Technology
1.	User Interface	How the user interacts with the application .To depict the human-computer interaction andcommunication.	HTML, CSS,JSP
2.	Application Logic-1	A page to upload images as input	Python

5.3 User Stories

UserType	Functional Requirement (Epic)	User Story Number	User Story/ Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user,I can register for the applicationby entering my email,password, and confirming my password.	I can access my account/dashboard	High	Sprint-1
	Login	USN-2	As a user, I can log intothe application by entering email& password	I can login using my Email ID accounts or usercredentials	High	Sprint-1
	Dashboard	USN-3	As a user, I can view the page of the application where i can upload my images and the fertilizer should be recommended	I can access my account/dashboard	High	Sprint-2
Customer (Webuser)	Registration	USN-4	As a user, I can loginto web dashboardjust Like websitedashboard	I can registerusing my username and password	High	Sprint-3
	Login	USN-5	As a user, I can login to my webdashboard withthe login credentials	I can login using my Usercredentials	High	Sprint-3
	Dashboard	USN-6	As a user, I can view the web application where i can upload my images and thefertilizer should be recommended	I can access my account/dashboard	High	Sprint-4
		USN-7	As a user, the fertilizer recommendedto me shouldbe of higher accuracy	I can accessmy account/dashb oard	High	Sprint-4

Administrator	Login	USN-8	As a admin, I can loginto the websiteusing my login credentials	I can loginto thewebsite using my logincredentials	High	Sprint-5
	Dashboard	USN-9	As a admin, I can view the dashboard of the application	I can access my dashboard	High	Sprint-5

6.PROJECT PLANNING AND SCHEDULING

6.1 Sprint Planning and Estimation

Sprint	Total Story Points	Duration	Sprint StartDate	Sprint EndDate(Planned)	StoryPointsCompleted (as onPlanned End Date)	SprintRelease Date(Actual)
Sprint-1	20	6Days	30Oct2022	04 Nov2022	10	05Oct2022
Sprint-2	20	6Days	01Nov222	06 Nov2022	15	07Oct2022
Sprint-3	20	6Days	30Nov222	04 Nov2022	15	05 Nov2022
Sprint-4	20	6Days	14Nov222	19 Nov2022	10	20 Nov2022

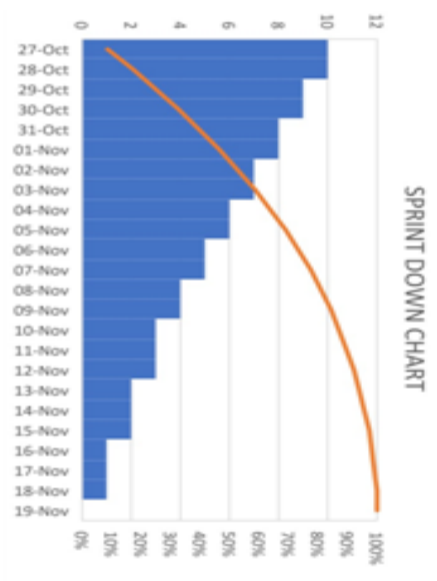

6.2 Sprint Delivery Schedule

Sprint	Duration	SprintStartDate	SprintEndDate(Planned)	SprintReleaseDate(Actual)
Sprint-1	6Days	30Oct2022	04 Nov2022	05Oct2022
Sprint-2	6Days	01Nov2022	06 Nov2022	07Oct2022
Sprint-3	6Days	30 Nov2022	04 Nov2022	05 Nov2022
Sprint-4	6Days	14 Nov2022	19 Nov2022	20 Nov2022

Velocity: Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (pointsper sprint). Let's calculate the team's average velocity (AV)per iteration unit (story points perday)

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

            print(df.iloc[preds]['caution'])
```

8.TESTING

8.1 Testcases

A test case has components that describe input, action and an expected response, in order to determine if a feature of an application is working correctly. A test case is a set of instructions on “HOW” to validate a particular test objective/target, which when followed will tell us if the expected behaviour of the system is satisfied or not.

Characteristics of a good test case:

- Accurate: Exacts the purpose.
- Traceable: Capable of being traced to requirements.
- Repeatable: Can be used to perform the test over and over.
- Reusable: Can be reused if necessary.

10.ADVANTAGES AND DISADVANTAGES

ADVANTAGES:

- 1.Prediction of disease of a plant using leaf images in early stages.
- 2.Giving the precautions to the plants according to the plant condition.
- 3.Recommends the fertilizers for the particular disease.
- 4.It doesn't require dany chemical to test the disease.
- 5.Simple way to predict the disease by taking Images.

DISADVANTAGES:

- 1.It predicts the disease for the plants which are given in the Dataset only.
- 2.It cannot predict the disease for the plants which are not present in the Dataset.
- 3.Sometimes it may predict the wrong fertilizers which leads to loss.

11.CONCLUSION

Different approaches and models of Deep Learning methods were explored and used in this project so that it can detect and classify plant diseases correctly through image processing of leaves of the plants. The procedure starts from collecting the images used for training, testing and

validation to image pre-processing and augmentation and finally comparison of different pre-trained models over their accuracy. Finally, at the end, our model detects and distinguishes between a healthy plant and different diseases and provides suitable remedies so as to cure the disease. This paper proposed and developed a system which uses plant leaf images to detect different types of disease in potatoes, and also provides appropriate fertilizer suggestions.

12.FUTURE SCOPE

The system successfully interprets various Diseases and is also capable of providing fertilizer suggestion for the respective disease. Furthermore, this system can be made more robust by incorporating more image dataset with wider variations like more than one leaf in a single image. An App could also be developed for the project which could make the work of the farmers easier. They could directly upload image on the app and it would tell the disease and the cure then and there. This would reduce the time and efforts. This project is limited to just one crop for now but in the future more crops and even flowers dataset can be added so that it is helpful for every agricultural need. Newer models can also be added and tried with time which may result in better accuracy and would make the model even faster.
